

GAMA × Tasker

How to automate graphics API switching

Last updated: 31.08.2026

Before You Start

- **Install Shizuku** (running and authorised for GAMA); alternatively, rooted-device access already granted to GAMA.
- **Install GAMA** and make sure it can already switch the renderer manually
- **Install Tasker** (available on the Play Store).

Why GAMA used a token

Tasker sends a broadcast that other installed apps could also try to send. Your token is a private key that proves the request came from a Tasker task you configured. Keep it private: anyone who has it can ask GAMA to change your renderer via Tasker (as low as those chances are). **Each GAMA installation gets its own random token.**

- GAMA generates 32 random characters.
- Those characters are then stored locally in GAMA's private preferences.
- The token remains the same after reboot and normal app updates.
- The token changes when GAMA's app data is cleared or the app is uninstalled/reinstalled.
- Backups intentionally exclude it, so restored installations require copying a new token into Tasker.

There is no manual "renew/rotate token" button; clearing app data is the only way to generate a new one.

How to Get the Token

1. Open GAMA.
2. Tap on "Resources" (you can find the button on the bottom-right)
3. Tap on the "TASKER" button
4. Tap on "Copy token"

GAMA's token will not be displayed in-app, it will simply be copied to your clipboard. This will be useful later.

Settings up Tasker

A Task is a sequence of actions that Tasker runs when a certain Profile gets triggered.

Step 1 - Create the Task

1. Open Tasker and tap the Tasks tab (2nd tab from left-to-right).
2. Tap the + button in the bottom-right corner (if you get a “TaskerNet” pop-up dialog, simply choose the “CREATE” option).
3. Name the task “Switch to Vulkan” (or however you’d like!).
4. Tap ✓ to confirm.

Step 2 - Add “Send Intent” as an Action

1. Tap the + button in the bottom-right corner to add an Action.
2. Scroll down and tap “System”.
3. Scroll down and tap “Send Intent”.

Step 3 - Fill in the “Send Intent” form

Enter these four fields exactly. They identify GAMA’s Tasker receiver.

Field	Enter
Action	com.popovicialinc.gama.ACTION_SET_RENDERER
Package	com.popovicialinc.gama
Class	com.popovicialinc.gama.TaskerReceiver
Target	Broadcast Receiver

Leave Cat, Data, Mime Type, and every other field empty.

Step 4 – Fill in the “Extra” fields

Field	What you can enter	Is this required?	Purpose
Extra (1)	“renderer:vulkan” or “renderer:opengl”	Yes	Switches the graphics API to Vulkan, or, alternatively, OpenGL
Extra (2)	“token:<paste your copied token>” (without these characters < >)	Yes	Proves this Tasker task is allowed to control GAMA
Extra (3)	“aggressive:true” or “aggressive:false”	No	Force-stops ALL apps after switching. You can choose not to fill this one in, leaving the 3 rd Extra field empty; the Aggressive mode is disabled by default (it has some nuclear repercussions)

The “Extra” fields tell GAMA what to do. You should have 3 of them. Do not add quotation and do not put spaces around the colon.

Step 5 – Save the “Send Intent” form

1. Tap the back arrow in the top-left of the screen to save the “Send Intent” form.
2. Tap the back arrow once again to save the Task.
3. Tap ✓ to save the task.

Test Before Automating

1. In Tasker’s Tasks tab (try saying that 3 times as fast as you can), tap on “Switch to Vulkan” (or however you named the Task you just created).
2. Tap the play button in the bottom-left corner.
3. Wait a moment, and then you should see “Switched to Vulkan” on the bottom of the screen. Alternatively, open GAMA. The current renderer should now report Vulkan.
4. If nothing changed, use the troubleshooting checklist.

Trigger the Task Automatically

Once the manual test works, attach the task to any Tasker Profile you prefer.

1. Go to the “Profiles” tab (1st tab left-to-right).
2. Click the + button in the bottom-right corner.
3. Once again, if you get a “TaskerNet” pop-up, choose “CREATE”.
4. Now, you can choose your trigger based on what suits you best
 - a. Application
 - b. Day
 - c. Event
 - d. Location
 - e. State
 - f. Time
5. For this example, choose **Event → Sensor → Shake**. Configure Axis, Sensitivity, and Duration if you want to, then tap the back arrow in the top-left corner.
6. Tasker will ask you to associate the profile with a task. Select the existing ‘Switch to Vulkan’ task - or whichever name you gave your GAMA task.
7. Press the ✓ button to save the Profile.
8. **And you’re done!** Your profile is now fully configured, and when the selected trigger occurs, Tasker will run the GAMA renderer-switching task.

You can attach several Profiles to the same task. Test every profile once; GAMA must still have working Shizuku or root access when Tasker runs it.

Troubleshooting

What you see	Check this
Task runs but the renderer does not actually change	Open GAMA and confirm Shizuku is running and authorised, or that root access has been granted. Check that the “Send Intent” form is filled correctly
The task stopped working after restoring a backup or clearing GAMA data	Copy the new token from GAMA and replace the token extra in every Tasker task. Tokens are intentionally not restored from Android backups.
