

GAMA × Tasker

How to automate graphics API switching

Before You Start

This guide creates one Tasker task that tells GAMA to use Vulkan or OpenGL. Complete the steps in order and test the task before attaching it to a profile.

- ✓ Install GAMA and make sure it can already switch the renderer manually.
- ✓ Use either Shizuku (running and authorised for GAMA) or rooted-device access already granted to GAMA.
- ✓ Install Tasker.

Why GAMA uses a token

Tasker sends a broadcast that other installed apps could also try to send. Your token is a private key that proves the request came from a Tasker task you configured. It is not an account password and is never sent to GAMA's servers. Keep it private: anyone who has it can ask GAMA to change your renderer.

Set Up the Token First

Step 1 — Copy your personal GAMA token

- ✓ Open GAMA.
- ✓ Open Library.
- ✓ On the TASKER card, tap Set up.
- ✓ Read the short explanation, then tap Copy token. Leave it on your clipboard until Step 4.
- ✓ Tap Open full guide if you need to return here later. The token stays the same on this device unless GAMA data is cleared.

Do not post the token in screenshots, issue reports, or shared Tasker exports.

Create a Vulkan Task

A Task is a sequence of actions Tasker runs when triggered. The following creates a Vulkan task. Repeat it later with `renderer:opengl` if you also want an OpenGL task.

Step 2 — Create the task

- ✓ Open Tasker and tap the Tasks tab.
- ✓ Tap the + button in the bottom-right corner.

- ✓ Name the task Switch to Vulkan.
- ✓ Tap ✓ to confirm.

Step 3 — Add Send Intent

- ✓ Tap + to add an action.
- ✓ Scroll down and tap System.
- ✓ Scroll down and tap Send Intent.

Step 4 — Fill in the Send Intent form

Enter these four fields exactly. They identify GAMA's Tasker receiver.

Field	Enter exactly this
Action	com.popovicialinc.gama.ACTION_SET_RENDERER
Package	com.popovicialinc.gama
Class	com.popovicialinc.gama.TaskerReceiver
Target	Broadcast Receiver

Leave Cat, Data, Mime Type, and every other field empty.

Add the Extras

Extras tell GAMA what to do. In Tasker's Extras section, tap + and create the following separate key:value entries. Do not add quotation marks and do not put spaces around the colon.

Extra	Enter exactly this	Required	Purpose
Renderer	renderer:vulkan	Yes	Switches GAMA to Vulkan.
Token	token:<paste your copied token>	Yes	Proves this Tasker task is allowed to control GAMA.
Aggressive	aggressive:true	No	Force-stops apps after switching. It is off by default.

Step 5 — Add and save the extras

- ✓ Tap + next to Extras and enter renderer:vulkan.
- ✓ Tap + again. Type token:, then paste the token you copied from GAMA immediately after the colon. Example: token:AbCd... (your token will be different).
- ✓ Only if you understand that open apps will be closed, tap + once more and enter aggressive:true.
- ✓ Tap the back arrow to save Send Intent, then go back again and tap ✓ to save the task.

To make an OpenGL task, duplicate this task, rename it Switch to OpenGL, and change only renderer:vulkan to renderer:opengl. Keep the same token.

Test Before Automating

Step 6 — Run the task manually

- ✓ In Tasker's Tasks tab, select Switch to Vulkan.

- ✓ Tap the play button in the bottom-left corner.
- ✓ Wait a moment, then open GAMA. The current renderer should report Vulkan.
- ✓ If it did not change, use the troubleshooting checklist below before creating a Profile.

Trigger the Task Automatically

Once the manual test works, attach the task to any Tasker Profile you prefer.

By time of day

- ✓ Profiles tab → + → Time.
- ✓ Set the time, go back, then select Switch to Vulkan.

When connecting to Wi-Fi

- ✓ Profiles tab → + → State → Net → WiFi Connected.
- ✓ Set the SSID, go back, then select your task.

When an app opens

- ✓ Profiles tab → + → Application.
- ✓ Select the app or apps, go back, then select your task.

You can attach several Profiles to the same task. Test every profile once; GAMA must still have working Shizuku or root access when Tasker runs it.

Troubleshooting

What you see	Check this
Task runs but the renderer does not change	Open GAMA and confirm Shizuku is running and authorised, or that root access has been granted. Tasker cannot start or authorise Shizuku for you.
Nothing happens at all	Re-open GAMA → Library → Tasker → Set up, copy the token again, and make sure the Tasker extra is token:<that exact token>. The token entry is required.
GAMA says to use renderer:vulkan or renderer:opengl	Use lowercase vulkan or opengl, with no spaces around the colon.
The wrong GAMA component opens	Set Target to Broadcast Receiver. Do not select Activity or Service.
The task stopped working after restoring a backup or clearing GAMA data	Copy the new token from GAMA and replace the token extra in every Tasker task. Tokens are intentionally not restored from Android backups.
Apps close after the switch	Remove aggressive:true. That optional extra tells GAMA to force-stop apps.

Quick Reference

Setting	Vulkan task	OpenGL task
Action	Same as the Send Intent table above	Same as the Send Intent table above
Package	com.popovicialinc.gama	com.popovicialinc.gama
Class	com.popovicialinc.gama.TaskerReceiver	com.popovicialinc.gama.TaskerReceiver
Target	Broadcast Receiver	Broadcast Receiver
Required extras	renderer:vulkan token:<your token>	renderer:opengl token:<your token>
